

Guideline for Pitch Presentations

(Recorded Video, max. 5 min)

Introduction: ~ 1 min

- Begin with an engaging fact or scenario related to anomaly detection – you can be creative!
- Introduce yourself and the title of your paper on recent developments in anomaly detection and out-of-distribution detection.
- Explain why anomaly detection is a crucial area of study and, hence, your chosen paper, highlighting its relevance in various fields such as cybersecurity, manufacturing, finance, healthcare, etc.

Problem Statement: ~ 1 min

- Define the challenges in anomaly detection, especially, the ones which are approached by your chosen paper, and the need for robust out-of-distribution detection methods.
- Illustrate the impact of undetected anomalies in given real-world scenarios, emphasizing its significance across different fields.
- Provide a brief overview of recent trends and advancements in the field – which other papers are highly related to your chosen paper?

Framework Overview: ~ 1 min

- Present a concise overview of the framework or algorithm proposed in your paper – use a pointer and give a walk through the method. *Hint: Try to explain it to an imaginary junior ML/AI expert (who has fundamental knowledge but has not read the paper in detail)*

- Explain how it addresses the limitations of existing methods in anomaly detection and out-of-distribution detection.
- Summarise the technical aspects of the framework within the allotted time – go only into detail, if necessary - it is still *only* a pitch presentation.

Key Findings: ~ 1 min

- Highlight the key findings or performance improvements achieved by the proposed approach.
- Mention the effectiveness of the method through comparisons with state-of-the-art techniques – try to be as concise as possible, e.g., summarise or reduce tables to their most interesting experiments/findings.
- Discuss the implications of these findings for enhancing anomaly detection capabilities in specific fields.

Application: ~ 0.5 min

- Offer insights into how researchers and practitioners can apply this advanced approach in their work across different domains.
- Provide examples or use cases where the framework can be applied, showcasing its versatility.
- Address potential challenges or limitations in implementing the proposed method.

Conclusion: ~ 0.5 min

- Summarise the significance of this paper in advancing anomaly detection and out-of-distribution detection.
- Emphasise the relevance of these advancements for researchers and practitioners in the mentioned fields.
- Encourage further exploration and experimentation with the proposed approach.
